

Use-Case Name : Allocate ER Bed

Primary Actor: Triage Nurse

Preconditions:

- The Triage Nurse is authenticated and logged into the emergency room dashboard.
- The system has dynamically ordered the waitlist based on computed triage severity scores.

Postconditions:

- The assigned ER bed is marked as occupied in the database.
- The real-time ward occupancy dashboard is updated across all connected clients.

Main Success Scenario:

1. The Triage Nurse selects a patient from the dynamically ordered ER bed waitlist.
2. The dashboard displays a list of currently available ER beds.
3. The Triage Nurse assigns a specific ER bed to the selected patient.
4. The system updates the real-time ward occupancy dashboard.
5. The bed status transitions to "Occupied" and propagates to all dashboard clients.

Alternate Flow: 3a. ICU Overflow

- **3a1.** The patient's triage severity score requires an ICU bed, but the dashboard shows all ICU beds are currently full.
- **3a2.** The Triage Nurse selects the "Request Transfer" option on the patient's profile.
- **3a3.** The system orchestrates the inter-facility ambulance transfer workflow to move the patient to another hospital.
- **3a4.** The use case ends.
