Reflection Questions :

1. Did your estimations reflect the actual effort?

-Yes, using the Fibonacci sequence helped scale the complexity appropriately. The ambulance transfer integration (8 points) was estimated higher due to external dependencies, while a simple capacity update (2 points) was lower.

2. Was your backlog well-prioritized?

-Yes, tasks critical to immediate patient care (computing triage scores and allocating beds) were prioritized as High, while administrative maintenance was marked Low.

3.How did your simulated sprint align with your plan?

-The sprint successfully simulated a rapid Agile iteration. By moving tickets from To Do -> In Progress -> Done, we visually tracked the completion of the 23 total story points committed to Sprint 1.

4. What insights did the burndown chart give about your team's capacity?

-The burndown chart illustrated how quickly story points were resolved over the sprint timeframe. A steady slope indicates accurate estimation, whereas sharp drops indicate work was completed in bulk rather than continuously.
